

# Working with Y fitting and PUTZMAUS®

1. Insert PUTZMAUS® into Y fitting
2. Screw brush on to PUTZMAUS® tool and connect air hose
3. Connect vacuum hose to Y fitting
4. Line up brush with tube and press down on lever  
( Caution !! always use gloves !! )
5. PUTZMAUS® is now activated and will automatically move through Y fitting and tube.  
Keep holding vacuum cleaner hose and Y fitting until PUTZMAUS® is back, lever will open automatically and stop PUTZMAUS®
6. Now again press down on lever and remove Y fitting with PUTZMAUS® (Y fitting to stay with PUTZMAUS® trough out the cleaning of all the heat exchanger tubes as demonstrated in picture below, newer let brush go back trough Y fitting during cleaning !!!)
7. Start again with point 4.) with the next tube

If the heat exchanger tubes are not too dirty (short cleaning cycles) it is an alternate to work without Y fitting.

Use PUTZMAUS® the same time as the build in suction blower of the system is on ( 100% ) Most of the dust the PUTZMAUS® creates will be sucked thru the Multizyklon in to the combustion chamber and there collected in the dust collector of the system.
